

1. In a system that includes an MPEG decoder and has access to a stored MPEG stream, a method for displaying a reconstructed MPEG stream based on the stored MPEG stream in an accelerated speed in a forward or reverse mode, comprising:

an act of identifying, from an index of I-frames of the stored MPEG stream, selected I-frames to be included in the reconstructed MPEG stream;

an act of generating the reconstructed MPEG stream by including the selected I-frames in the reconstructed MPEG stream and inserting one or more blank P-frames between temporally adjacent I-frames, the I-frames and P-frames included in the reconstructed MPEG stream being selected to generate a playback rate and a bit rate; and

an act of decoding the reconstructed MPEG stream using the MPEG decoder for display on a display device associated with the system.

2. The method as recited in claim 1, wherein the stored MPEG stream includes a set of temporally adjacent frames in the sequence I-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame.

3. The method as recited in claim 1, wherein the stored MPEG stream includes a repeating frame sequence, wherein the frame sequence is a set of temporally adjacent frames in the sequence I-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame, and wherein the frame sequence repeats one or more times.

4. The method as recited in claim 1, wherein the system comprises a home entertainment system.

5. The method as recited in claim 4, wherein the home entertainment system is associated with a computer network.

6. The method as recited in claim 1, where I-frames selected for the reconstructed MPEG stream are temporally adjacent I-frames in the stored MPEG steam.

7. The method as recited in claim 1, wherein the act of identifying I-frames of the stored MPEG stream comprises skipping one or more I-frames after each selected I-frame.

8. The method as recited in claim 1, wherein the act of generating the reconstructed MPEG stream comprises inserting one blank P-frame between each of the selected I-frames.

9. The method as recited in claim 1, wherein the act of generating the reconstructed MPEG stream comprises inserting two or more blank P-frames between each of the selected I-frames.

10. The method as recited in claim 1, wherein a blank B-frame is inserted between each of the selected I-frames.

1           11.    The method as recited in claim 10, wherein the blank B-frames are also  
2 used to generate the playback rate and the bit rate.

12. In a system that includes an MPEG decoder and has access to a stored MPEG stream, a method for displaying a reconstructed MPEG stream based on the stored MPEG stream in an accelerated speed in a forward or reverse mode, comprising:

a step for reconstructing an MPEG stream by selecting one or more I-frames from the stored MPEG stream and inserting one or more blank frames between the I-frames to generate a playback rate and a bit rate; and

an act of decoding the reconstructed MPEG stream using the MPEG decoder for display on a display device associated with the system.

13. The method as recited in claim 12, wherein the type of frame inserted between the I-frames is a P-frame.

14. The method as recited in claim 12, wherein the type of frame inserted between the I-frames is a B-frame.

15. The method as recited in claim 12, wherein the selected one or more I-frames are temporally adjacent in the stored MPEG stream.

16. The method as recited in claim 12, wherein one or more I-frames in the stored MPEG stream are skipped after selection of an I-frame in the stored MPEG stream for use in generating the reconstructed MPEG stream.

1           17.     A computer program product for implementing, in a system that includes an  
2 MPEG decoder and has access to a stored MPEG stream, a method for displaying a  
3 reconstructed MPEG stream based on the stored MPEG stream in an accelerated speed in a  
4 forward or reverse mode, the computer program product comprising:

5                     a computer-readable medium carrying computer-readable instructions, that  
6 when executed at the server system, cause the system to perform the following:

7                     an act of identifying, from an index of I-frames of the stored MPEG  
8 stream, selected I-frames to be included in the reconstructed MPEG stream;

9                     an act of generating the reconstructed MPEG stream by including  
10 the selected I-frames in the reconstructed MPEG stream and inserting one  
11 or more blank P-frames between temporally adjacent I-frames, the I-frames  
12 and P-frames included in the reconstructed MPEG stream being selected to  
13 generate a playback rate and a bit rate; and

14                     an act of decoding the reconstructed MPEG stream using the MPEG  
15 decoder for display on a display device associated with the system.

16  
17           18.     The computer program product as recited in claim 17, wherein the  
18 computer-readable medium comprises one or more physical storage media.  
19

1           19. In a system that includes an MPEG decoder and has access to a stored  
2 MPEG stream that includes I-frames, P-frames, and B-frames, a method for displaying the  
3 stored MPEG stream in a reverse mode without requiring simultaneous buffering of all  
4 frames between temporally adjacent I-frames, comprising:

5                 an act of buffering two temporally adjacent I-frames, including a first I-  
6 frame and a second I-frame that is temporally later in the stored MPEG stream;

7                 based on the first I-frame, an act of iteratively reconstructing and buffering  
8 P-frames until a particular P-frame that is temporally adjacent to the second I-frame  
9 is reconstructed and buffered;

10                an act of displaying video data encoded in the second I-frame;

11                an act of reconstructing and displaying video data encoded in each B-frame  
12 between the reconstructed particular P-frame and the second I-frame in reverse  
13 order;

14                an act of displaying video data encoded in the reconstructed particular P-  
15 frame; and

16                an act of iteratively reconstructing other P-frames and B-frames between the  
17 first I-frame and the particular reconstructed P-frame to continue displaying video  
18 data encoded in frames in the reverse sequence compared to the original sequence  
19 without simultaneously buffering all frames between the first I-frame and the  
20 second I-frame.

21  
22           20. The method as recited in claim 19, wherein the act of iteratively  
23 reconstructing and buffering P-frames comprises an act of simultaneously buffering all P-  
24 frames.

1  
2 21. The method as recited in claim 19, wherein the act of iteratively  
3 reconstructing and buffering P-frames comprises the following:

4 an act of reconstructing a temporally first P-frame after the first I-frame  
5 using the first I-frame;

6 an act of buffering the temporally first P-frame after the act of  
7 reconstructing the temporally first P-frame;

8 an act of releasing the buffer that stored the first I-frame after the act of  
9 buffering the temporally first P-frame; and

10 an act of repeating the acts of reconstructing, buffering and releasing for  
11 successive P-frames until the particular P-frame is buffered.  
12

13 22. The method as recited in claim 19, wherein the MPEG decoder uses three  
14 needed buffers and "m" spare buffers, wherein the second I-frame is buffered in one of the  
15 three needed buffers, wherein the first I-frame is initially buffered in another of the three  
16 needed buffers initially leaving one empty needed buffer, wherein the act of iteratively  
17 reconstructing and buffering P-frames comprises the following:

18 an act of reconstructing a temporally first P-frame after the first I-frame  
19 using the first I-frame;

20 an act of buffering the temporally first P-frame after the act of  
21 reconstructing the temporally first P-frame;

22 an act of determining whether or not to copy the first I-frame into one of the  
23 "m" spare buffers;

1 an act of copying the first I-frame into one of the "m" spare buffers if it has  
2 been determined that the first I-frame is to be copied into one of the "m" spare  
3 buffers;

4 an act of releasing the buffer that stored the first I-frame after the act of  
5 determining whether or not to copy the first I-frame into one of the "m" spare  
6 buffers;

7 an act of determining whether or not to copy the first P-frame into one of  
8 the "m" spare buffers;

9 an act of copying the first P-frame into one of the "m" spare buffers if it has  
10 been determined that the first P-frame is to be copied into one of the "m" spare  
11 buffers; and

12 an act of repeating the acts of reconstructing, buffering, determining and  
13 releasing for successive P-frames until the particular P-frame is buffered.

14  
15 23. A method as recited in Claim 22, wherein the act of determining whether or  
16 not to copy the first P-frame into one of the "m" spare buffers comprises the following:

17 an act of determining that the first P-frame is to be copied into one of the  
18 "m" spare buffers if any of the following conditions are true:

19 the first P-frame is temporally at least  $1/(1+n)$ th of the way from the  
20 temporally last frame stored in the spare buffers to the temporally last frame  
21 stored in the needed buffers, where "n" is the number of unused spare  
22 buffers; or

23 there is only one P-frame between the first P-frame and the  
24 temporally last frame in the needed buffers.

1  
2           24.     The method as recited in Claim 23, further comprising repeating the act of  
3 determining that the first P-frame is to be copied into one of the "n" spare buffers, for all  
4 other P-frames temporally later than the first P-frame, but temporally earlier than the  
5 second I-frame.

6  
7           25.     The method as recited in Claim 22, wherein the act of determining whether  
8 or not to copy the first I-frame into one of the "m" spare buffers comprises the following:

9                     an act of determining that the first I-frame is not to be copied into one of the  
10                    "m" spare buffers regardless of the number of spare buffers available.

11  
12           26.     The method as recited in claim 19, wherein the stored MPEG stream  
13 includes a set of temporally adjacent frames in the sequence I-frame, B-frame, B-frame, P-  
14 frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-frame, B-frame, B-frame, P-  
15 frame, B-frame, B-frame.

16  
17           27.     The method as recited in claim 19, wherein the system comprises a home  
18 entertainment system.

19  
20           28.     The method as recited in claim 27, wherein the home entertainment system  
21 is associated with a computer network.

22  
23           29.     The method as recited in claim 19, wherein once the video data encoded in  
24 a B-frame is displayed all memory buffers associated with the B-frame are released.

1           30. In a system that includes an MPEG decoder and has access to a stored  
2 MPEG stream that includes I-frames, P-frames, and B-frames, a method for displaying the  
3 stored MPEG stream in a reverse mode without requiring simultaneous buffering of all  
4 frames between temporally adjacent I-frames, comprising:

5                 an act of buffering two temporally adjacent I-frames, including a first I-  
6 frame and a second I-frame that is temporally later in the stored MPEG stream;

7                 a step for displaying video data encoded in the second I-frame, a particular  
8 reconstructed P-frame temporally adjacent to the second I-frame, and reconstructed  
9 B-frames between the second I-frame and the particular reconstructed P-frame, in  
10 reverse sequence, the particular reconstructed P-frame having been iteratively  
11 reconstructed from the first I-frame; and

12                 an act of iteratively reconstructing other B-frames between the first I-frame  
13 and the particular reconstructed P-frame to continue displaying video data encoded  
14 in frames in the reverse sequence compared to the original sequence without  
15 simultaneously buffering all frames between the first I-frame and the second I-  
16 frame.

17  
18           31. The method as recited in claim 30, wherein two B-frames are reconstructed  
19 between the second I-frame and the particular reconstructed P-frame.

20  
21           32. The method as recited in claim 31, wherein the video data encoded in the  
22 second I-frame is displayed, then the video data encoded in the two reconstructed B-frames  
23 are displayed and then video data encoded in the particularly reconstructed P-frame is  
24 displayed.

1           33.     A computer program product for implementing, in a system that includes an  
2 MPEG decoder and has access to a stored MPEG stream that includes I-frames, P-frames,  
3 and B-frames, a method for displaying the stored MPEG stream in a reverse mode without  
4 requiring simultaneous buffering of all frames between temporally adjacent I-frames, the  
5 computer product comprising:

6                     a computer-readable medium carrying computer-readable instructions, that  
7 when executed at the server system, cause the system to perform the following:

8                     an act of buffering two temporally adjacent I-frames, including a  
9 first I-frame and a second I-frame that is temporally later in the stored  
10 MPEG stream;

11                    based on the first I-frame, an act of iteratively reconstructing and  
12 buffering P-frames until a particular P-frame that is temporally adjacent to  
13 the second I-frame is reconstructed and buffered;

14                    an act of displaying video data encoded in the second I-frame;

15                    an act of reconstructing and displaying video data encoded in each  
16 B-frame between the reconstructed particular P-frame and the second I-  
17 frame in reverse order;

18                    an act of displaying video data encoded in the reconstructed  
19 particular P-frame; and

20                    an act of iteratively reconstructing other B-frames between the first  
21 I-frame and the particular reconstructed P-frame to continue displaying  
22 video data encoded in frames in the reverse sequence compared to the  
23 original sequence without simultaneously buffering all frames between the  
24 first I-frame and the second I-frame.

1  
2  
3

34. The computer program product as recited in claim 33, wherein the computer-readable medium comprises one or more physical storage media.
